I have a personal website that is running under Windows 11 pro and the community version of IIS.

I have ASP.net and PHP enabled but I am having trouble getting server side includes to work even though I have gone into the Windows features under the control panel where IIS is enabled and turned that feature on.

I am concerned that I am not correctly forming my code and would like some expert samples.

The example I am looking for would use my own heading and Cookies Compliance JavaScript then feature a downloaded or online version of a ChatGPT session.

To enable server-side includes (SSI) on IIS, there are a few steps you need to follow, but let's focus on creating a working example for you. You may want to ensure that SSI is set up correctly in IIS and that the file extensions you're using (e.g., .shtml) are correctly recognized for SSI processing.

1. Enable SSI in IIS

You've already turned on the feature for SSI in the Windows features, but ensure the file extensions you're using are correctly mapped to process with the `iis_iss` handler. Here's a quick
